

# Demo of admonition styles in DocOnce

H. P. Langtangen

May 2, 2015

## Abstract

This note demonstrates how admonitions look like in the output format `pdflatex`.

## 1 The four main types of admonitions

Key options when compiling this document were

```
--latex_admon=paragraph
```

Here is the warning admon:

**Division by zero is illegal!** Most math systems will give fatal errors if you divide by zero.

```
Terminal> python -c 'print 4/0'
Traceback (most recent call last):
  File "<string>", line 1, in <module>
ZeroDivisionError: integer division or modulo by zero
```

Question admon (without title).

**Question.** What are the admon options for `doconce format html`?  
Summary admon:

**Summary.** The most popular methods for solving algebraic equations

$$f(x) = 0$$

are

- Newton's method
- The Bisection method
- The Secant method
- The Fixed-Point method ( $f(x) = x - g(x)$ )

Notice admon:

**Tip: following well-established conventions for variable names!** For example, in Python, variable and function names use lower case letters separated by underscore, as in `vibration_with_damping` (while Java typically would have `vibrationWithDamping`). Class names apply cap words, as in `ProblemClass`.

## 2 The block, quote and plain box environment

DocOnce features a `block` environment with or without title.

Blocks are often used in slides to frame a collection of things.

**Block with title.** Blocks can contain text, math, code, figures, movies.  
Here is a quote environment (`quote`):

Sayre's law states that "in any dispute the intensity of feeling is inversely proportional to the value of the issues at stake."  
By way of corollary, it adds:  
"That is why academic politics are so bitter."  
*Source:* [wikipedia](#)

Boxes are very simple frames (without any icons, background color, or stash, except for a shadow) used for important results like

The world most famous equation:

$$E = mc^2$$
