## On Schemes for Exponential Decay

### Hans Petter Langtangen<sup>1,2</sup>

Center for Biomedical Computing, Simula Research Laboratory  $^{1}$  Department of Informatics, University of Oslo $^{2}$ 

Sep 26, 2014

### Goal

The primary goal of this demo talk is to demonstrate how to write talks with DocOnce and get them rendered in numerous HTML formats.

### Layout

This version utilizes beamer slides with the theme blue\_plain.

# We aim to solve the (almost) simplest possible differential equation problem

$$u'(t) = -au(t) \tag{1}$$

$$u'(t) = -au(t)$$
 (1)  
 $u(0) = I$  (2)

#### Here,

- ▶  $t \in (0, T]$
- $\triangleright$  a, I, and T are prescribed parameters
- $\triangleright$  u(t) is the unknown function
- ► The ODE (??) has the initial condition (??)

## The ODE problem is solved by a finite difference scheme

- ightharpoonup Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- lacksquare Assume constant  $\Delta t = t_n t_{n-1}$
- $\triangleright$   $u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

## The ODE problem is solved by a finite difference scheme

- ▶ Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant  $\Delta t = t_n t_{n-1}$
- $\triangleright$   $u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

## The ODE problem is solved by a finite difference scheme

- ▶ Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant  $\Delta t = t_n t_{n-1}$
- $ightharpoonup u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

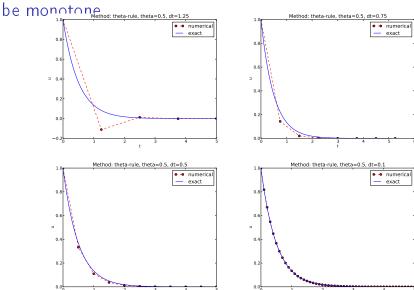

### The Forward Euler scheme explained

http://youtube.com/PtJrPEIHNJw

### **Implementation**

The numerical method is implemented in a Python function:

The Crank-Nicolson method shows oscillatory behavior for not sufficiently small time steps, while the solution should

Exact solution of the scheme

$$u^n = A^n, \quad A = rac{1-(1- heta)a\Delta t}{1+ heta a\Delta t}.$$

Key results:

- Stability: |A| < 1
- ightharpoonup No oscillations: A > 0
- ▶ Always for Backward Euler ( $\theta = 1$ )
- $\Delta t < 1/a$  for Forward Euler ( $\theta = 0$ )
- $ightharpoonup \Delta t < 2/a$  for Crank-Nicolson (heta = 1/2)

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

### Key results:

- ▶ Stability: |A| < 1
- ightharpoonup No oscillations: A > 0
- ightharpoonup Always for Backward Euler (heta=1)
- $ightharpoonup \Delta t < 1/a$  for Forward Euler (heta = 0)
- $ightharpoonup \Delta t < 2/a$  for Crank-Nicolson ( heta = 1/2)

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

Key results:

- ▶ Stability: |A| < 1
- ▶ No oscillations: A > 0
- Always for Backward Euler  $(\theta=1)$
- $ightharpoonup \Delta t < 1/a$  for Forward Euler  $(\theta = 0)$
- $\Delta t < 2/a$  for Crank-Nicolson  $(\theta = 1/2)$

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

Key results:

- ▶ Stability: |A| < 1
- ▶ No oscillations: A > 0
- ▶ Always for Backward Euler ( $\theta = 1$ )
- $\Delta t < 1/a$  for Forward Euler  $(\theta = 0)$
- ▶  $\Delta t < 2/a$  for Crank-Nicolson ( $\theta = 1/2$ )
