Goal

The primary goal of this demo talk is to demonstrate how to write talks with DocOnce and get them rendered in numerous HTML formats.

Lavout

This version utilizes beamer slides with the theme red_shadow.

Mathematical problem

$$u'(t) = -au(t), \qquad (1)$$

$$u(0) = I, (2)$$

- t ∈ (0, T]
- a, I, and T are prescribed parameters
- u(t) is the unknown function

Numerical solution method

- Mesh in time: $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant $\Delta t = t_n t_{n-1}$
- \bullet u^n : numerical approx to the exact solution at t_n

Numerical scheme:

$$u^{n+1}=rac{1-(1- heta)a\Delta t}{1+ heta a\Delta t}u^n,\quad n=0,1,\ldots,N-1$$

Forward Euler explained

http://youtube.com/PtJrPEIHNJw

Implementation

The numerical method is implemented in a Python function:

```
def solver(I, a, T, dt, theta):

"""Solve u'=-a*u, u(0)=I, for t in (0,T] with steps of dt."""

dt = float(dt)  # avoid integer division

N = int(round(T/dt))  # no of time intervals

T = N*dt  # adjust T to fit time step dt

u = zeros(N+1)  # array of u[n] values

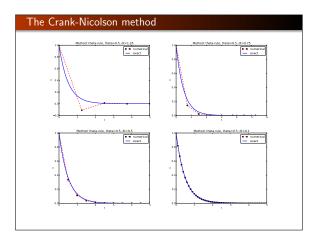

t = linspace(0, T, N*1)  # time mesh

u[0] = I  # assign initial condition

for n in range(0, N):  # n=0,1,...,N=I

u[n+1] = (1 - (1-theta)*a*dt)/(1 + theta*dt*a)*u[n]

return u, t
```

The artifacts can be explained by some theory

Exact solution of the scheme:

$$u^n = A^n, \quad A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}.$$

- Stability: |A| < 1
- No oscillations: A > 0
- ullet Always for Backward Euler (heta=1)
- ullet $\Delta t < 1/a$ for Forward Euler (heta = 0)
- $\Delta t < 2/a$ for Crank-Nicolson ($\theta = 1/2$)

Concluding remarks:

Only the Backward Euler scheme is guaranteed to always give qualitatively correct results.
