1 Data file

Suppose we have some data in a file. The final result of including this file with <code>@@@CODE</code> mydat.txt (which implies a code environment starting with !bc dat) looks like this:

#	А	В	C	D	E
	-0.5253	-0.9315	-0.3427	-0.1613	-0.8472
	-0.9740	-0.2558	-0.5622	-0.7635	-0.0914
	0.9216	0.7702	-0.4818	0.2155	0.2967

2 Complete program and terminal output

The following program (which breaks a page) reads the data in the file and performs analysis (typeset with !bc pypro):

```
np.corrcoef(data)

if __name__ == '__main__':
    data = readfile('mydat.txt')
    # Treat each column as a variable
    m, s, c = analyze(data.transpose())
    print """

mean=%f
st.dev=%f
correlation matrix:
%s
""" % (m, s, c)
```

The output becomes (typeset with !bc sys):

3 Code snippet

Fortran 77 is also sometimes handy (typeset with !bc fcod):

```
subroutine process(a, n, c, r)

C    Return array r = c*a
    integer n
    real*8 a(n), c, r(n)
    integer i
    do i = 1,n
        r(i) = c*a(i)
    end do
    return
    end
```
