1 Data file

Suppose we have some data in a file typeset with !bc dat:

```
D
                                               Е
-0.5253
           -0.9315
                      -0.3427
                                 -0.1613
                                            -0.8472
-0.9740
           -0.2558
                      -0.5622
                                 -0.7635
                                            -0.0914
0.9216
            0.7702
                      -0.4818
                                  0.2155
                                             0.2967
```

2 Complete program and terminal output

The following program (which breaks a page) reads the data in the file and performs analysis (typeset with !bc pypro):

```
#!/usr/bin/env python

import numpy as np

def readfile(filename):
    """Read tabular data from file and return as numpy array."""
    f = open(filename, 'r')
    data = [] # list of rows in table
    for line in f:
        if line.startswith('#'):
            continue # drop comment lines
        numbers = [float(w) for w in line.split()]
        data.append(numbers)
    return np.array(data)
```

The output becomes (typeset with !bc sys):

3 Code snippet

Fortran 77 is also sometimes handy (typeset with !bc fcod):

```
subroutine process(a, n, c, r)
C Return array r = c*a
integer n
real*8 a(n), c, r(n)
integer i
do i = 1,n
    r(i) = c*a(i)
end do
return
end
```
