## 1 Data file

Suppose we have some data in a file. The final result of including this file with @@@CODE mydat.txt (which implies a code environment starting with !bc dat) looks like this:

```
С
                                                Е
  Α
              В
                                    D
-0.5253
           -0.9315
                      -0.3427
                                 -0.1613
                                             -0.8472
-0.9740
           -0.2558
                      -0.5622
                                 -0.7635
                                             -0.0914
0.9216
            0.7702
                      -0.4818
                                  0.2155
                                              0.2967
```

## 2 Complete program and terminal output

The following program (which breaks a page) reads the data in the file and performs analysis (typeset with !bc pypro):

```
import numpy as np

def readfile(filename):
    """Read tabular data from file and return as numpy array."""
    f = open(filename, 'r')
    data = [] # list of rows in table
    for line in f:
        if line.startswith('#'):
            continue # drop comment lines
        numbers = [float(w) for w in line.split()]
        data.append(numbers)
    return np.array(data)
```

The output becomes (typeset with !bc sys):

```
Terminal
Terminal> python fileread.py
mean = -0.006005
st.dev=0.583542
correlation matrix:
            [[ 1.
[ 0.0509676
                      -0.30920845 -0.12129049 0.7611538 ]
            1.
[ 0.52406366 -0.30920845 1.
                                 0.49355806 -0.42263817]
 [ 0.20964645 -0.12129049  0.49355806  1.
                                          -0.38286589]
            0.7611538 -0.42263817 -0.38286589 1.
 [ 0.1574504
```

## 3 Code snippet

Fortran 77 is also sometimes handy. Snippets in that language are typeset inside  $!bc\ fcod\ environments$ .

```
Fortran code box. r_i = ca_i, \quad i = 1, \dots, n
```

```
subroutine process(a, n, c, r)

C This subroutine returns array r = c*a
integer n
real*8 a(n), c, r(n)
integer i
do i = 1,n
    r(i) = c*a(i)
end do
return
end
```
