1 Data file

Suppose we have some data in a file. The final result of including this file with <code>@@@CODE</code> mydat.txt (which implies a code environment starting with !bc dat) looks like this:

```
# A B C D E
-0.5253 -0.9315 -0.3427 -0.1613 -0.8472
-0.9740 -0.2558 -0.5622 -0.7635 -0.0914
0.9216 0.7702 -0.4818 0.2155 0.2967
```

2 Complete program and terminal output

The following program (which breaks a page) reads the data in the file and performs analysis (typeset with !bc pypro):

```
#!/usr/bin/env python
    import numpy as np
4
    def readfile(filename):
        """Read tabular data from file and return as numpy array."""
        f = open(filename, 'r')
        data = [] # list of rows in table
        for line in f:
            if line.startswith('#'):
10
                continue # drop comment lines
            numbers = [float(w) for w in line.split()]
            data.append(numbers)
13
        return np.array(data)
    def analyze(data):
```

```
"""Return statistical measures of an array data."""
         return np.mean(data), \
                np.std(data), \
19
                np.corrcoef(data)
    if __name__ == '__main__':
22
        data = readfile('mydat.txt')
         # Treat each column as a variable
        m, s, c = analyze(data.transpose())
25
        print """
    mean=%f
    st.dev=%f
28
    correlation matrix:
    """ % (m, s, c)
```

The output becomes (typeset with !bc sys):

```
Terminal
Terminal> python fileread.py
mean = -0.006005
st.dev=0.583542
correlation matrix:
              0.0509676
                         0.52406366 0.20964645 0.1574504 ]
[[ 1.
 [ 0.0509676
                         -0.30920845 -0.12129049 0.7611538 ]
              1.
 [ 0.52406366 -0.30920845
                         1.
                                      0.49355806 -0.42263817]
 0.20964645 -0.12129049 0.49355806 1.
                                                 -0.38286589]
              0.7611538 -0.42263817 -0.38286589
 [ 0.1574504
```

3 Code snippet

Fortran 77 is also sometimes handy (typeset with !bc fcod):

```
subroutine process(a, n, c, r)

Return array r = c*a
integer n
    real*8 a(n), c, r(n)
integer i
    do i = 1,n
        r(i) = c*a(i)

end do
    return
end
```
