Testing PGF and TikZ support in DocOnce

Kristian Gregorius Hustad (krihus@ifi.uio.no)

Aug 5, 2016

Abstract

Quick demo of how to make figures with TikZ in DocOnce.

1 Ideas

TikZ is a very strong tool for making figures in LaTeX. DocOnce supports such figures: if a figure file myfig exists in a version myfig.tikz, DocOnce will, in case of latex or pdflatex output, utilize the myfig.tikz figure directly. The problem is what do to with other output formats. In HTML formats (html and sphinx), one can use a corresponding SVG version of the figure, and for more primitive formats, one needs a plain PNG version. A utility script, doconce tikz2fig (?), can be used to convert a TikZ figure to SVG or PNG format:

Terminal > doconce tikz2fig myfig.tikz

The result is myfig.svg and myfig.png to be stored along with myfig.tikz.

2 A modest beginning

Figure 1: This shape is commonly referred to as a straight line.

The most fundamental shape is the line in Figure 1. See the source code for how this TikZ figure is defined in LATEX. Such lines can be combined to form other shapes, e.g., a square as in Figure 2.

A grid can also be made from straight lines.

A circle, however, cannot be formed by a finite number of straight lines. It requires special code.

kgh 1: filenames identical to words in the texts have been known to cause problems **hpl 2**: Not anymore?

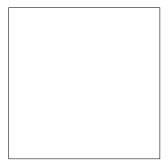

Figure 2: This square is formed by four straight lines.

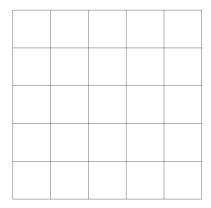

Figure 3: This is a grid with 5 x 5 cells

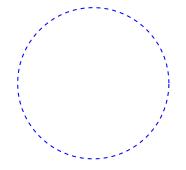

Figure 4: This circle is drawn in blue with a dashed line.

3 More advanced figures

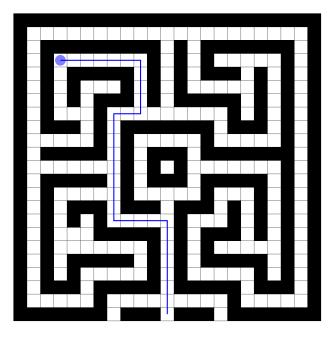

Figure 5: A maze can be drawn by combining the elements above.

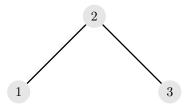

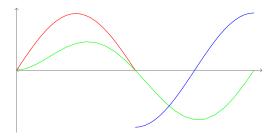

Figure 6: TikZ is quite well suited to draw graphs.

4 Plotting functions

TikZ can be used to plot functions. The next figure will be inlined.

See the source code for how you make this figure.

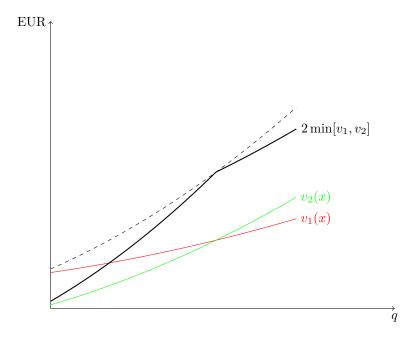

Figure 7: The functions can even be labeled!

All details are in the source code.
