Goal

The primary goal of this demo talk is to demonstrate how to write talks with Doc Once and get them rendered in numerous HTML formats.

Layout

This version utilizes beamer slides with the theme dark_gradient.

Problem setting and methods

We aim to solve the (almost) simplest possible differential equation problem

$$u'(t) = -au(t) \tag{1}$$

$$u(0) = I \tag{2}$$

Here,

- $t \in (0, T]$
- a, I, and T are prescribed parameters
- u(t) is the unknown function
- The ODE (1) has the initial condition (2)

The ODE problem is solved by a finite difference scheme

- Mesh in time: $0 = t_0 < t_1 \cdots < t_N = 7$
- ullet Assume constant $\Delta t = t_n t_{n-1}$
- \bullet u^n : numerical approx to the exact solution at t_n

The θ rule

$$u^{n+1} = \frac{1 - (1 - \theta) a \Delta t}{1 + \theta a \Delta t} u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ($\theta=0$), the Backward Euler ($\theta=1$), and the Crank-Nicolson ($\theta=0.5$) schemes.

The ODE problem is solved by a finite difference scheme

- Mesh in time: $0 = t_0 < t_1 \cdots < t_N = T$
- ullet Assume constant $\Delta t = t_n t_{n-1}$
- u^n : numerical approx to the exact solution at t_n

The θ rule

$$z^{n+1} = 1 - (1- heta) a \Delta t$$
 , $n = n = 0, 1, \dots, N$

contains the Forward Euler ($\theta=0$), the Backward Euler ($\theta=1$), and the Crank-Nicolson ($\theta=0.5$) schemes.

The ODE problem is solved by a finite difference scheme

- Mesh in time: $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant $\Delta t = t_n t_{n-1}$
- u^n : numerical approx to the exact solution at t_n

The θ rule,

$$u^{n+1}=rac{1-(1- heta)\mathsf{a}\Delta t}{1+ heta\mathsf{a}\Delta t}u^n,\quad n=0,1,\ldots,N-1$$

contains the Forward Euler ($\theta=0$), the Backward Euler ($\theta=1$), and the Crank-Nicolson ($\theta=0.5$) schemes.

Implementation

Implementation in a Python function:

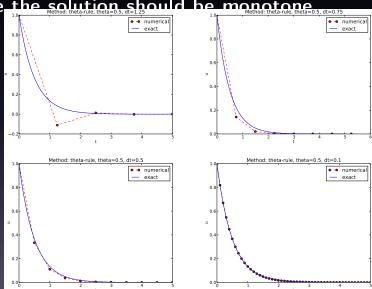

Problem setting and methods

Nesuru

Results

The Crank-Nicolson method shows oscillatory behavior for not sufficiently small time steps, while the solution should be monotone.

Exact solution of the scheme

$$u^n = A^n$$
, $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$

Key results:

- Stability: |A| < 1
- No oscillations: A > 0
- $\Delta t < 1/a$ for Forward Euler ($\theta = 0$
- $\Delta t < 2/a$ for Crank-Nicolson ($\theta = 1/2$)

Concluding remarks:

Only the Packward Euler scheme is guaranteed to always give

Exact solution of the scheme:

$$u^n = A^n, \quad A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}.$$

Key results:

- Stability: |A| < 1
- No oscillations: A > 0
- $\Delta t < 1/a$ for Forward Euler ($\theta = 0$)

Concluding remarks:

Exact solution of the scheme:

$$u^n = A^n, \quad A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}.$$

Key results:

- Stability: |A| < 1
- No oscillations: A > 0
- $\Delta t < 1/a$ for Forward Euler $(\theta = 0)$
- ullet $\Delta t < 2/a$ for Crank-Nicolson (heta = 1/2)

Concluding remarks:

Exact solution of the scheme:

$$u^n = A^n, \quad A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}.$$

Key results:

- Stability: |A| < 1
- No oscillations: A > 0
- $\Delta t < 1/a$ for Forward Euler (heta = 0)
- $\Delta t < 2/a$ for Crank-Nicolson ($\theta = 1/2$)

Concluding remarks:

Only the Backward Euler scheme is guaranteed to always give
